# **Course Instructor:-**

Dr.Parijat Bhowmik Assistant Professor, Dept of EEE

#### **Objective:**

Consider an inverted pendulum on a moving platform, assuming M = 2 kg, m = 0. 15 kg, l = m.

- a) Find the state-space model of the system in MATLAB if  $x1 = \theta$ ,  $x2 = '\theta$ , x3 = x, x4 = 'x,  $y1 = x1 = \theta$  and y2 = x3 = x
- b) Write down system transfer function in MATLAB.
- c) Design a state feedback control with gain -K so that the closed-loop poles are located at s = -4 + 2j, s = -4 2j, s = -10, s = -10
- d) Check Controllability and Observability of the system in MATLAB
- e) Use MATLAB to plot the step response of the system. Show simulink model

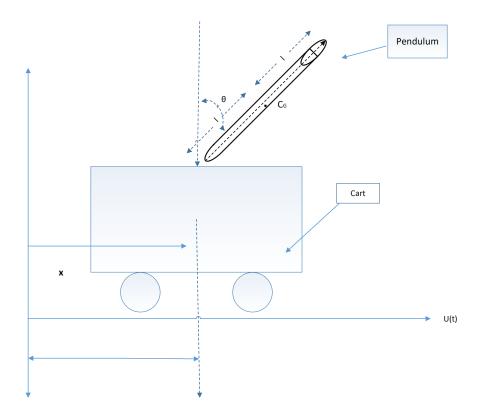

Fig.1 - Inverted Pendulum System

**Cart**: Horizontal position=*x* 

**Pendulum**: Horizontal position= $x+lSin\theta$ Vertical position= $lCos\theta$ 

The Dynamic behavior of system is described by-

For Cart- Position and Velocity

## For Pendulum- Angular position and angular Velocity

#### State -

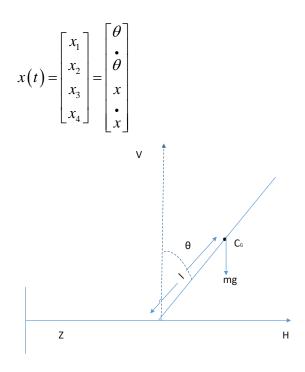

Fig.2-Free body diagram of Inverted Pendulum

M=mass of cart

m=mass of pendulum

J=moment of Inertia of pendulum with respect to center of gravity

$$J\frac{d^2\theta}{dt^2} = Vl\sin\theta - Hl\cos\theta \qquad - (i)$$

Forces in vertical direction:

$$V - mg = m\frac{d^2}{dt^2}(l\cos\theta)$$
 - (ii)

Forces in Horizontal direction:

$$H = m\frac{d^2}{dt^2}(x + l\sin\theta)$$
 - (iii)

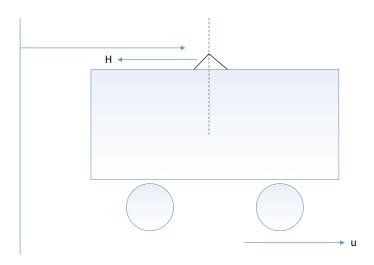

Fig.3-Free body diagram of Cart

Forces in cart in Horizontal direction:

$$\mathbf{u} - \mathbf{H} = \mathbf{M} \frac{d^2 x}{dt^2} - (i\mathbf{v})$$

Our objective is to keep pendulum upright so it seems  $\theta$  is close to zero.

$$\sin\theta \simeq \theta$$
,  $\cos\theta \simeq 1$ 

In view of approximation we get equation (i),(ii),(iii),(iv) becomes-

$$J\overset{\bullet}{\theta} = Vl\theta - Hl \qquad - (i)$$

$$V - mg = m\frac{d}{dt}(l) - (ii)$$

$$H = m \frac{d^2}{dt^2} [x + l\theta] \implies H = m x + m l \theta \qquad - \text{(iii)}$$

$$u-H=Mx$$
 - (iv)

Using iv equation-

$$u = H + M \xrightarrow{x} u = (m \times + Ml \theta) + M \xrightarrow{x}$$

$$u = (m + M) \times + Ml \theta$$
- (v)

Using i equation-

$$J \stackrel{\bullet \bullet}{\theta} = Vl\theta - Hl$$

Since, 
$$V = mg$$
,  $H = m x + ml \theta$ 

$$J \stackrel{\bullet}{\theta} = [mg]l\theta - [mx + ml \theta]l$$

$$J \stackrel{\bullet}{\theta} = mgl\theta - mxl - ml^2 \stackrel{\bullet}{\theta}$$

$$(J+ml^2)\theta + ml x - mgl\theta = 0$$
 (vi)

Equation v and vi-

Type equation here.

$$u = (m+M)x+Ml\theta - (v)$$

$$(J+ml^2)\theta + ml x - mgl\theta = 0$$
 - (vi)

The equation can be rearranged as-

$$\overset{\bullet}{\theta} = \frac{ml(M+m)g}{(M+m)J+mMl^2}\theta - \frac{ml}{(M+m)J+mMl^2}u$$

$$\dot{x} = -\frac{m^2 l^2 g}{(M+m)J + mMl^2} \theta + \frac{(J+ml^2)}{(M+m)J + mMl^2} u$$

The system parameters are-

$$M = 2kg, m = 0.5kg, l = 1m$$
  
 $g = 9.81m/\sec^2$   
 $J = 0.2kg - m^2$ 

For these parameters-

$$\theta = 8.175\theta - 0.33u$$
  
 $x = -3.27\theta + 0.466u$ 

Choosing the states-

$$x_1 = \theta, x_2 = \theta, x_3 = x, x_4 = x$$

We obtain the state model for inverted pendulum on moving cart

$$X = Ax + Bu$$

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 8.175 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 \\ -3.27 & 0 & 0 & 0 \end{bmatrix}; B = \begin{bmatrix} 0 \\ -0.333 \\ 0 \\ 0.466 \end{bmatrix}$$

with

# Transfer function model:

Now the transfer function of this system can be obtained using:

$$\frac{Y(s)}{U(s)} = C(sI - A)^{-1}B + D$$

Where 
$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 8.175 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 \\ -3.27 & 0 & 0 & 0 \end{bmatrix}$$
,  $B = \begin{bmatrix} 0 \\ -0.33 \\ 0 \\ 0.467 \end{bmatrix}$ ,  $C = \begin{bmatrix} 1 & 0 & 0 & 0 \end{bmatrix}$  (for  $\theta$ ),  $D = 0$ 

So now,

$$(sI - A)^{-1} = \begin{bmatrix} s * \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} - \begin{pmatrix} 0 & 1 & 0 & 0 \\ 8.175 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 \\ -3.27 & 0 & 0 & 0 \end{pmatrix} \end{bmatrix}$$

$$= \begin{bmatrix} s & -1 & 0 & 0 \\ -8.175 & s & 0 & 0 \\ 0 & 0 & s & -1 \\ 3.27 & 0 & 0 & s \end{bmatrix}^{-1}$$

$$= \frac{1}{s^2(s^2 - 8.175)} \begin{bmatrix} s^3 & s^2 & 0 & 0 \\ -8.175s^2 & s^3 & 0 & 0 \\ -3.27s & -3.27 & s^3 - 8.175s & s^2 - 8.175 \\ -3.27s^2 & -3.27s & 0 & s^3 - 8.175s \end{bmatrix}$$

## So , Transfer function with respect to angular displacment.

$$\frac{\theta(s)}{U(s)} = C(sI - A)^{-1}B + D = \frac{-0.33s^2}{s^2 - 8.175}$$

## Similarly, Transfer function with respect to linear displacment

$$\frac{x(s)}{U(s)} = \frac{0.467s^2 - 2.7386}{s^2(s^2 - 8.175)}$$

# Matlab code for finding transfer function

%code for finding transfer function
clc;
clear all;

```
% Initialising A,B,C,D matrices
A=[0
     1 0
                   0;
  8.175 0 0
                    0;
  0 0 0
-3.27 0 0
                   1;
                   0];
B= [ 0;
   -0.33;
     0;
   0.467];
                       % for theta
C1 = [1 0 0 0];
C2= [0 0 1 0];
                         % for x(displacement)
D = 0;
%Tranfer function with respect to Theta
[num1,den1]=ss2tf(A,B,C1,D);
sys1=tf(num1,den1)
% Transfer function with respect to x(Translational Displacement
[num2,den2]=ss2tf(A,B,C2,D);
sys2=tf(num2,den2)
% display the output
```

# Matlab code for finding controllability and observability

```
%here we are checking the controllability and observability
clc;
clear all;
close all;
  0 1 0 0;
8.175 0 0 0;
A=[0
   0 0 0
                    1;
  -3.27 0 0
                    0];
B= [ 0;
   -0.33;
     0;
   0.467];
%checking controllabilty
S=ctrb(A,B);
rank(S)
%checking observability for angular displacement(theta)
C1 = [1 0 0 0];
P1= obsv(A,C1);
```

```
rank(P1)
%%checking observability for linear displacement(x)
C2= [0 0 1 0];
P2=obsv(A,C2);
rank(P2)
```

#### **Result:**

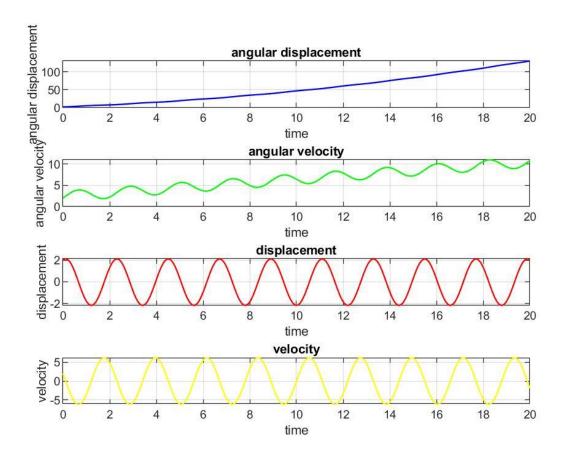

From the output we observe that the system is fully controllable and the system is not completely observable for angular displacement because the observability matrix is not full rank, and it is completely observable for linear displacement

### Controller Design

# Output:

Simulation Model for system with controller for step input with disturbance

# Output:

# **Conclusion:**

We have successfully placed the poles in the desired pole location and achieved stability, and our state feedback controller is strong enough to bear any disturbance.
